

Food Inspections Assignment

A Data Analyst Journey

The aim is to analyze, model, and visualize food inspection data to uncover insights and improve public health transparency

- Dealing with Food Establishment Inspections in two cities
 - [Chicago](#) and [Dallas](#)
 - Sample food inspection report of [Dallas](#) and [Chicago](#)
- All the above cities are recording data on food inspections
 - Note that both cities differ in **schema** such as The aim is to analyze, model, and visualize food inspection data to uncover insights and improve public health transparency
- **Tools to be used:**
 - Databricks for processing. However, data profile and cleansing you can do either in Databricks or Alteryx
 - ER studio / Navicat for data modeling

Food Establishment Inspections

Each part 25 Marks

- Deliverables – follow Medallion architecture wherever applicable
 - Part 1
 - Data is provided in a delimited format. Download it from [here](#)
 - Profile the data and document the findings (Alteryx or DQX can be used)
 - Goal is to understand structure, quality, characteristics
 - Helps to find common attributes to create a dataset which can be merged and loaded to target.
 - Part 2
 - Design Dimensional Model
 - Source to target mapping document to be created.
 - Deploy the model (Databricks final tables should match to this model)
 - Part 3
 - Load dimensional model
 - Read silver zone (cleansed) and load the model (Gold zone)
 - Name Dimensions and Facts with appropriate prefix such as dim_ / fact_
 - Implement SCD2 for any one of your choice of dimension table.
 - Part 4
 - Create BI dashboards
 - Power BI / Tableau (Any one of the tools usage is fine to create reports/dashboards)

Food Establishment Inspections

- Silver zone data validation rules to be incorporated as expectations (drop the bad rows)
 - Restaurant Name, Inspection Date and Type, Zip codes cannot be null
 - Zip codes cannot be null and should be in valid format
 - Violation score in Dallas cannot be more than 100
 - Chicago inspection results cannot be null
 - Every inspection must have at least 1 unique violation and duplication violations to be loaded as distinct
 - In Dallas dataset –
 - if violation score is 90 or more than we should not have more than 3 violation associated
 - Inspection result cannot be PASS if any of the violation contains Urgent/Critical terms
- Derive violation score for Chicago based on the table provided here →
- Remember –
 - All good practices discussed in the class must be incorporated
 - Profiling and analysis to be clearly documented
 - Cleansing Steps and adjustments performed to be documented
 - Submit screen shots clearly showing the end results
 - Code must be integrated to GIT as explained in class
 - Will grab the source code from GIT for grading
 - Git commits post due date will not be considered
 - Note that violation codes and descriptions in Chicago are not structured
 - Standardize the schema for violation codes and descriptions between both datasets so that you can store data properly
 - Dallas violations codes and Chicago violation codes dont need to match however, create a dim that stores both sets

Chicago Results	Derive score based on Results
Pass	90
Pass w/ Conditions	80
Fail	70
No Entry	0
All other types	NULl

What to show on Dashboard

Expected Visuals

- Examine food inspection results by:
 - Inspection result
 - Inspection type
 - Risk category
 - Facility type
 - Violations (Codes, descriptions)
 - Business inspected
 - DBA (Doing Business As), AKA (Also Know As), License
 - Location
- Inspection report
 - All above with inspection #, license #, violations & inspector comments

There are over 15,000 food establishments across the City of Chicago that are subject to sanitation inspections by the Department of Public Health. Three dozen inspectors are responsible for checking these establishments, which means one inspector is responsible for nearly 470 food establishments. The Department of Public Health has systematically collected the results of nearly 100,000 sanitation inspections; meanwhile, other city departments have collected data on 311 complaints, business characteristics, and other information. With this information, the city's advanced analytics team and Department of Public Health teamed up to forecast food establishments that are most likely to have critical violations so that they may be inspected first. The result is that food establishments with critical violations are more likely to be discovered earlier by the Department of Public Health's inspectors.

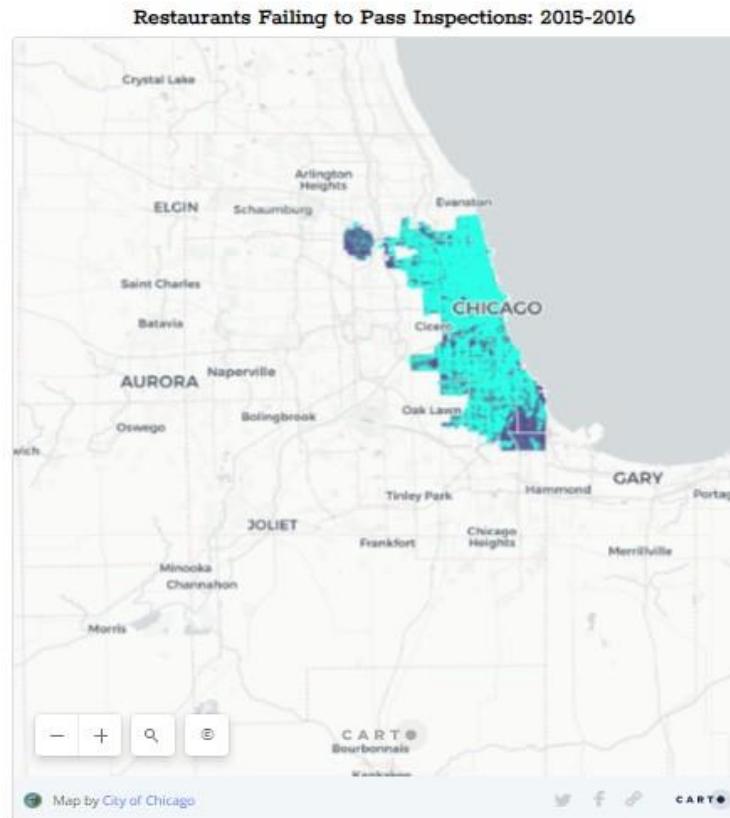

7 days
Improvements in number of days to discover restaurants with critical violations.
Food establishments with critical violations were discovered over one week earlier during a two-month evaluation.

Chicago Food Inspections

Open Data & Analytics

Collaboration was a key component of this project, with researchers at the Department of Innovation and Technology, Department of Public Health, Allstate Insurance Company, and Civic Consulting Alliance all working together. Each variable used in the model, with the exception of widely available weather and inspector data, was available on [Chicago's open data portal](#). The portal provides access to hundreds of datasets, which have been used to improve transparency, allow application development, and catalyze commercial activity for start-ups and large enterprises.

The portal was an effective tool to allow for such collaborative research. This project was able to leverage Chicago's key data assets: its large volume of data, the transparency and size of its open data portal, and its ability and willingness to conduct research to improve city services, introduce savings, and increase engagement with Chicago-area businesses.

Food Inspections

Health & Human Services

This information is derived from inspections of restaurants and other food establishments in Chicago from January 1, 2010 to the present. Inspections are performed by staff from the Chicago Department of Public Health's Food Protection Program using a standardized procedure. The results of the inspection are inputted into a database, then reviewed and [More](#)

Chicago Food Inspection – Health Code Requirements

- [City of Chicago :: Understand Health Code Requirements for Food Establishments](#)

The screenshot shows the City of Chicago Public Health website. The header includes the Chicago logo, accessibility options, a search bar, and a translate button. The main navigation menu has links for I WANT TO, PROGRAMS AND INITIATIVES, GOVERNMENT, ABOUT, and TRANSLATE. Below the menu, a blue banner displays 'Public Health' and 'Healthy Chicago'. The main content area features a large heading 'Understand Health Code Requirements for Food Establishments'. Below this, there are sections on 'There are Different Types of Health Inspections' (Business License Health Inspections, Routine Health Inspections, Complaint-Based Health Inspections), a detailed description of the inspection process, and a sidebar with links for Service Facts, I Want To, and various application forms like Apply For, Check Status Of, Find / Get, Pay For/Buy, Register, Report/File, Request, and Sign up for/Volunteer.

Health Code Violations

During routine inspections, or in response to a complaint a health inspector may issue one or more citations to the food establishment. These citations are based on the following violations:

Priority Violations

This category includes such occurrences as:

- Inadequate storage temperatures
- Improper food handling practices
- Improper personal hygiene
- Rodent and/or insect infestation
- Lack of hot running water

Priority violations create an immediate health hazard that carry a high-risk of causing food-borne illness. Priority violations must be corrected immediately; if they cannot be corrected immediately, the license will be suspended, and the food establishment must close. Once the violations are corrected, the food establishment operator must sign an affidavit stating the violations have been corrected, and schedule a follow-up inspection. All violations must be corrected in order for the establishment to reopen.

Priority Foundation Violations

This category includes such occurrences as:

- No certified food manager
- No written employee health policy
- Food not properly protected from contamination during storage, preparation, display, service, or transportation
- Inadequate pest control

Priority Foundation violations create a potential health hazard if not corrected in the timeframe specified by the health inspector. If serious violations are identified, an unannounced follow-up inspection will be conducted by the health inspector at a later date.

Core Violations

Core violations include such occurrences as:

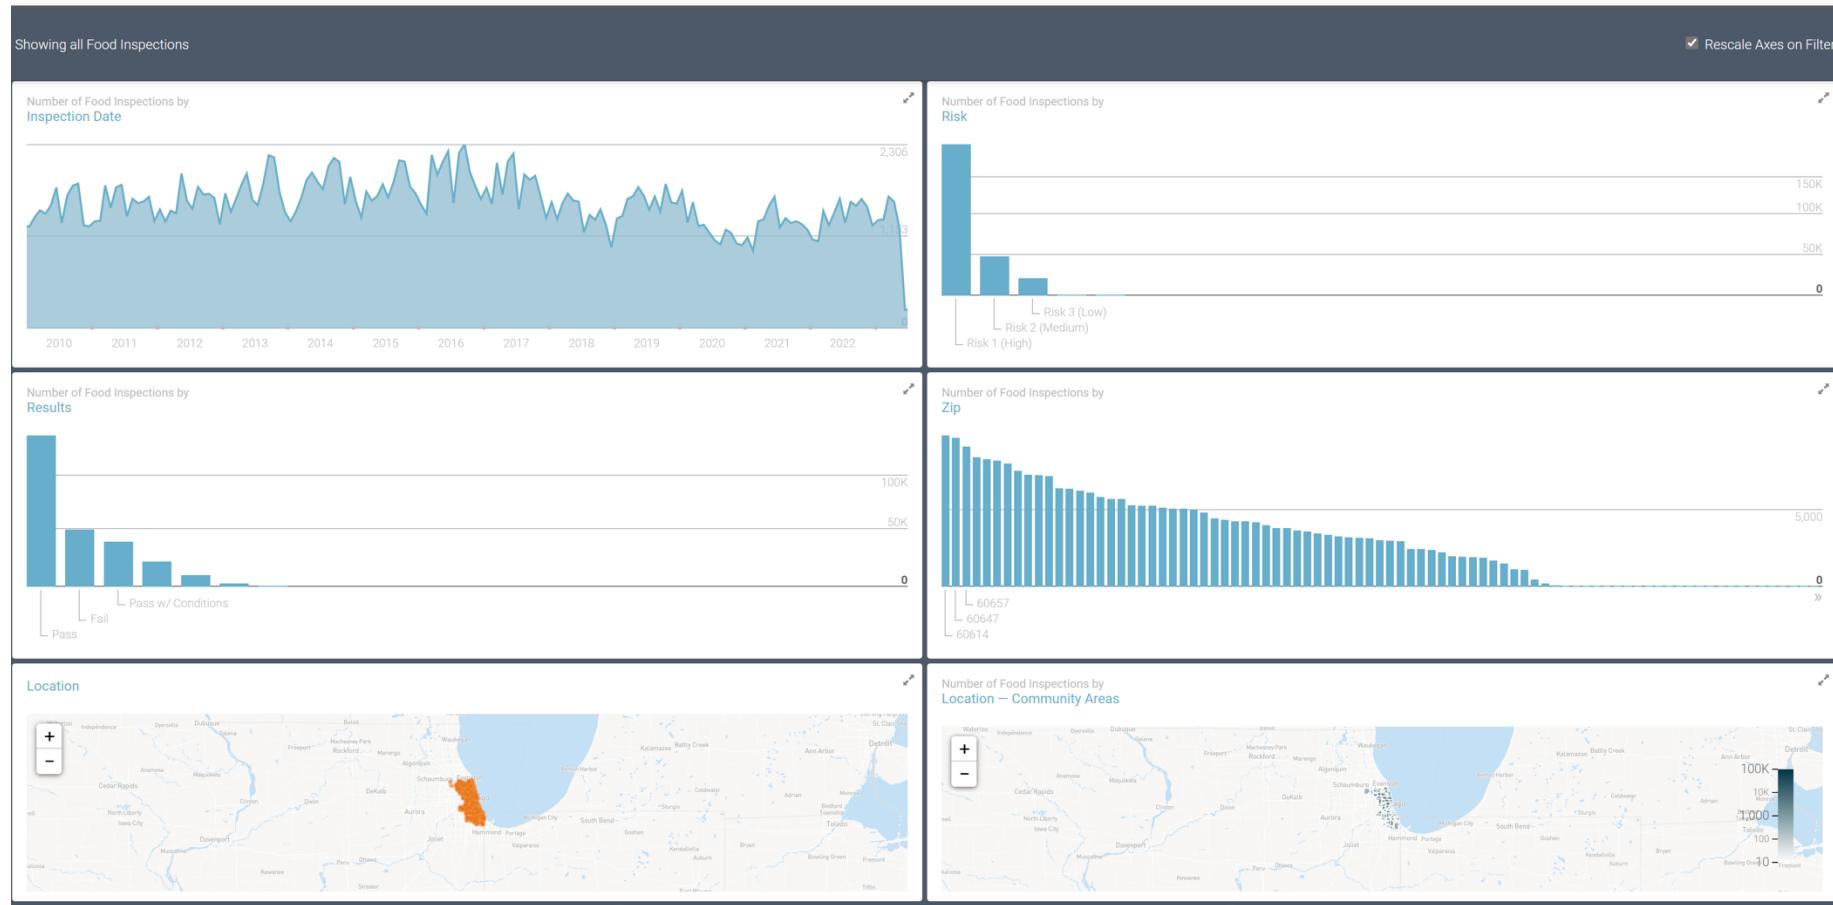

- Poorly constructed or maintained walls, ceilings or floors
- Improper storage of soiled and clean linens, coats, and aprons

Core violations do not pose an immediate threat to the public's health. A follow-up inspection is not performed if there are only Core violations. No citations are issued for Core violations.
